# **bmc**proactive

A comprehensive security solution that shields your business from cyberattacks, data breaches and backs up your critical data while continuously monitoring your systems.

US companies are experiencing a record number of data breaches, while most independent retailers struggle to address ever-changing security and maintenance needs. Gone are the days of 4-5 service subscriptions per location; BMC Proactive offers an all-in-one, single-source solution addressing the most important security and backup concerns.

Our solution includes automated monitoring, enterprise-grade antivirus, firewall management, managed patching, as well as secure automated offsite backups and remote access capabilities. BMC Proactive is the simplest, most comprehensive, affordable solution available on the market.

39% 39% of organizations were breached through insecure remote access.
81% 81% of hacking-related breaches leveraged either stolen and/or weak passwords.

80% 80% of hacking attacks could be prevented by strengthening passwords and installing patches.

*statistics based on a 2017 study by Security Metrics and a 2017 Verizon Data Breach Report

Secure Remote Access

Forced 2-factor authentication, a fully-encrypted connection, and removal of other remote access solutions are cornerstones of our industry-leading, self-hosted remote access software. Need to be able to print a report from home? Remotely access your work machine and print right to your printer. Auditing and reporting of access controls provide access to see who is logged in and for how long, which can be restricted down to a per-machine level.
Monitoring & Patching

Proactive automates standard maintenance processes and manages over 100 third-party program and Windows updates on all of your machines. Custom monitors address common POS failures and alert on hardware failures. Enforced password policies, structured to meet today's PCI compliance guidelines, provide an additional layer of security. Combined with advanced system logging, Proactive works for you to lessen down time.

Offsite Backups

Unlike many cloud services on the market which store data on servers owned by third parties, Proactive data is stored on BMC-owned servers in redundant offsite locations. Offsite backups are encrypted during transmission and storage using AES 256-bit encryption. Storing data locally allows for faster restores reducing your downtime.

Managed Antivirus

Proactive uses an industry-leading enterprise-grade antivirus solution which achieves perfect marks on AV tests year after year. Our comprehensive system requires no user interaction and the rules aren't user-modifiable, so virus definitions are always kept current and scans always happen. Our software can even restrict copying of data to external media at the click of a button.

Breach Insurance

Provides coverage for all merchants regardless of their PCI-DSS compliance up to $100,000 per MID, or an aggregate of $500,000 for merchants with multiple locations. Protects against the expenses associated with forensic exams, card replacement costs, and fines. No underwriting required.

Managed Firewall

Firewalls are essential to a well-secured system - Proactive includes the configuration and maintenance of your firewall to meet PCI guidelines. Unparalleled gateway monitoring, intrusion awareness, and content filtering work in sync to prevent unwanted cyber intrusions, all without user interaction or manual setup. Separate secure and guest WiFi networks add additional convenience and security.
